Datasheet for ABIN4829981 Human DDB1 cDNA Clone in Bacterial Expression Vector (His-GST)

Overview

Quantity:	500 ng
Gene:	DDB1
Species:	Human
Fusion tag:	His-GST
Insert:	cDNA
Vector:	Bacterial Expression Vector
Application:	Cloning (Clon)

Product Details

Insert Length:3423 bpVector Backbone:pPB-His-GSTPromoter:T7 PromoterBacterial Resistance:KanamycinExpression Type:TransientSpecificity:S-Nhel and 3-Xhol Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa)Sequencing Primer:GST Forward primer: 5'-CACGTTTGGTGGCGAC3', T7 terminator primer: 5'- GCTAGTTATTGCTCAGCGG-3'	Purpose:	Bacterial expression of Human DDB1 with His-GST
Promoter:T7 PromoterBacterial Resistance:KanamycinExpression Type:TransientSpecificity:5-Nhel and 3-Xhol Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa)Sequencing Primer:GST Forward primer: 5'-CACGTTTGGTGGTGGCGAC3', T7 terminator primer: 5'-	Insert Length:	3423 bp
Bacterial Resistance:KanamycinExpression Type:TransientSpecificity:5-Nhel and 3-Xhol Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa)Sequencing Primer:GST Forward primer: 5'-CACGTTTGGTGGTGGCGAC3', T7 terminator primer: 5'-	Vector Backbone:	pPB-His-GST
Expression Type:TransientSpecificity:5-Nhel and 3-Xhol Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa)Sequencing Primer:GST Forward primer: 5'-CACGTTTGGTGGCGAC3', T7 terminator primer: 5'-	Promoter:	T7 Promoter
Specificity: 5-Nhel and 3-Xhol Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa) Sequencing Primer: GST Forward primer: 5'-CACGTTTGGTGGCGAC3', T7 terminator primer: 5'-	Bacterial Resistance:	Kanamycin
Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein which is cleavable with TEV (Size 27.9 kDa)Sequencing Primer:GST Forward primer: 5'-CACGTTTGGTGGCGAC3', T7 terminator primer: 5'-	Expression Type:	Transient
	Specificity:	Fusion tag: Dual N-terminal tag, 6X Histidine followed by Glutathione-S-Transferase Protein
	Sequencing Primer:	

Target Details

Gene:

DDB1 (DDB1 Products) NM_001923
NM_001923
The pPB vectors are low-medium copy number vectors in which the gene expression is driven
by the strong T7 promoter.
Below are some basic guidelines for using the pPB vectors for protein production:
1. The pPB vectors are designed to be used with E. coli strains that are DE3 lysogens i.e. the
host E. coli cell has a source of T7 RNA polymerase.
2. Recombinant protein induction is usually done at OD600 of 0.6-1.2 using Isopropyl β -D-1-
thiogalactopyranoside (IPTG) at a final concentration of 0.05 -1mM.
3. The ideal concentration of IPTG must be determined empirically for each recombinant
protein/cell-line. Similarly, the length of time and temperature for induction provide other
variables that need to be optimized on a case-to-case basis.
4. For toxic proteins, it is recommended to go for shorter induction time and also to try and
suppress basal recombinant gene expression through (a) addition of glucose or use of pLysS
plasmid. Please note that special cell-lines are also available in the market that cater to expression of toxic proteins.
5. Once grown for the desired length of time, harvest cells by centrifugation and either freeze
the cells at -80°C (as such or after re-suspending in the desired buffer) or proceed with the
purification.
For Research Use only
Liquid
10 mM Tris-HCI, 1 mM EDTA, pH 8.0
-20 °C
