Target Details

Gene:	UGT2B28
Abstract:	UGT2B28 Products
Background:	This gene encodes a member of the uridine diphosphoglucuronosyltransferase protein family.
	The encoded enzyme catalyzes the transfer of glucuronic acid from uridine
	diphosphoglucuronic acid to a diverse array of substrates including steroid hormones and lipid-
	soluble drugs. This process, known as glucuronidation, is an intermediate step in the
	metabolism of steroids. Two transcript variants encoding different isoforms have been found
	for this gene. While both isoforms are targeted to the endoplasmic reticulum, only the longer
	isoform appears to be active.
